

Risk Assessment For Tandem Rollers

1. Excessive noise exposure can cause deafness, wear ear defenders. Report to the person in charge if you have none
2. Check security of forward/reverse control system daily, failure of this system can result in bodily injury.
3. Avoid hot areas of engine as burns can result.
4. Switch off engine when not in use, this reduces risk of roller moving off on its own .
5. Operators have been crushed by their own roller running them over after they have gotten off. OBSERVE ITEM 4.
6. Tampering with safety inhibitors can result in injury. Don't do it!
7. The roller should not be driven in a reckless fashion likely to cause injury to others.
8. Care must be taken when operating on un-even ground, to avoid roll-over. The safety harness should be worn.
9. Due to the fitting of a ROPS frame care needs to be taken when rolling near overhead obstructions, such as canopies, light fittings, along tall walls and structures.
10. Special care must be given when working near electrical cables which are to be found attached to buildings etc. Best to finish material with hand tools.
